Introduction to Artificial Intelligence and Machine Learning Lab

(CSN12601)

Lab Assignment – 1

S. N.	Questions
1.	Write a Python program to demonstrate different numeric data types in Python, such as int, float, and complex, including example values and their types.
2.	Write a Python program to demonstrate various type conversion functions , such as int() , float() , complex() , str() , and bool() , with suitable examples.
3.	Write a Python program to perform basic arithmetic operations on numbers (addition, subtraction, multiplication, division, modulus, exponentiation, and floor division) and display the results.
4.	Write a Python program to demonstrate logical operators (and, or, not) and bitwise operators, including: • Bitwise AND (&) • Bitwise OR () • Bitwise XOR (^) • Bitwise NOT (~) • Left shift (<<) • Right shift (>>) The program should use example inputs and clearly print the output of each operation.
5.	Write a Python program to create strings , concatenate them, print the result, and demonstrate substring access using indexing and slicing.
